ABSTRACT

[0040]   A method for operating a mobile communication terminal with an integrated

photographic apparatus is provided. The method comprises producing a first image from a first

object with the photographic apparatus; detecting a diagnostic element within the first image;

5   deriving at least a first value from the diagnostic element; deriving at least a first comprehensive

value from the first value; determining a first difference between the first comprehensive value

and a corresponding comprehensive initialization value derived from at least one initialization

value; and assigning a first operational function of the mobile communication terminal to the

first difference.
